

Detailed Data Requirements – Landslide Prediction Component

2. Rainfall Data

- Daily and 24-hour maximum rainfall records, per division
- Time period: last 20 years (2006–2026), or as far back as records exist
- Rainfall alert/warning threshold levels used (Watch/Alert/Evacuation mm values)
- Format: CSV or station-based time series, with station coordinates

3. Slope / Terrain Data

- Digital Elevation Model (DEM) or slope map for the three divisions
- Resolution (e.g. 30m, 10m)
- Slope angle bands/classification used (if any)
- Format: GeoTIFF or raster DEM

4. Historical Landslide Records

- Landslide event records for the last 20 years (2006–2026)
- For each event: date, exact location/coordinates, soil type at site, slope, rainfall trigger (if recorded), severity/damage
- Number of recorded events per division
- Format: CSV or shapefile with point locations

5. General / Metadata (for all of the above)

- Source agency and methodology used to collect/derive the data
- Survey/publication date and update frequency
- Any accuracy, confidence, or validation notes
- Licensing/usage terms for academic research
